Introduction

The female patient, born 1972 was suffering from sporadically Raynaud Phenomenon (RP) of both hands and feet since 2006. She complained of pains in the fingers and her left leg. In 2010 she had to stop her job because of increasing Raynaud and Raynaud-like phenomena. Since her condition was not improving any further, she had not seen any doctor. She was suffering from great emotional strain as the chief cause of systemic sclerosis.

2019: Some symptoms returned. RP was triggered by cold and had to be treated with anti-rheumatic drugs. She was also suffering from swollen legs and feet. In 2013, the patient was in severe physical suffering. The first symptoms were numbness and tingling in her lower legs, speech disturbance, and lightheadedness. A neurologist diagnosed a severe neuroendocrine disorder in 2014. However, the doctor prescribed anti-rheumatic drugs and anti-hypertensive medication. The patient decided to try alternative therapy and started with Tunc Therapy.

New treatment concept after changing the view

Announcement: we got the information that our patient was suffering from severe fatigue and emotional stress on a long-term basis. From a certain age on, she got new Raynaud symptoms when her sympathetic system was overstimulated. From this, it was clear, that Matrix Rhythm Therapy could help.

Matrix Rhythm Therapy

Matrix Rhythm Therapy is a medical treatment based on the natural synchronic architecture of living systems and the free and natural synchrony of our lives. It results from the laws of nature and the laws of physics. It is forming our “language of vertebrates” and is the unconscious social stimuli for our spontaneous movements. It is the “synchronous cooperation” and “coupling of oscillators” extracellular space. A specially designed resonator mechano-magnetically stimulates the physiological vibrations, especially of the skeletal muscles and the nervous system. It results from such reflexes? activated and later blocked. It is the unconscious social stimuli for our spontaneous movements. It is the unconscious social stimuli for our spontaneous movements.

Fledges and Diagnosis 2025

1. Alpha-Titer below 35.000, ACH positive. No new active pattern, no megacapillaries. No Raynaud, myotome. No problems when swallowing.
2. No Raynaud.
3. Pain and increased ADA in the endometrial parts. No problems when swallowing.
4. Enzymopathia delayed overall, retention of the esophagus passage.
5. Problems when swallowing.
6. Pain and increased ADA in the esophagus passage.
7. Enzymopathia delayed overall, retention of the esophagus passage.
8. Enzymopathia delayed overall, retention of the esophagus passage.
10. Enzymopathia delayed overall, retention of the esophagus passage.

Conclusion and prognosis

2019: The patient is still suffering from Raynaud and Raynaud-like phenomena. She is taking medications on a regular basis. At the time of the last visit, the patient was free of symptoms for the first time in 15 years.

New findings (2025)

1. Alpha-Titer below 35.000, ACH positive. No new active pattern, no megacapillaries. No Raynaud, myotome. No problems when swallowing.
2. No Raynaud.
3. Pain and increased ADA in the endometrial parts. No problems when swallowing.
4. Enzymopathia delayed overall, retention of the esophagus passage.
5. Problems when swallowing.
6. Pain and increased ADA in the esophagus passage.
7. Enzymopathia delayed overall, retention of the esophagus passage.
8. Enzymopathia delayed overall, retention of the esophagus passage.
10. Enzymopathia delayed overall, retention of the esophagus passage.

Discussion

The fact is that a modern society people fail to maintain a proper balance between their physical and mental health. Frequently the need for rest and recovery periods is ignored, which in the same time endangers both health and job performance. In this context,ierten network studies, emotional stress leads inevitably to muscle contractions, which persist as a kind of “memory.” In the course of our research, we have also observed symptom-specific reflexes in connective tissue from the elasticity and ability to return to a completely relaxed state. They become hardened and stiff, giving rise to symptoms in the skeletal, locomotor and nervous system. Lack of body movement leads to muscular stiffness, and ultimately, the sympathetic load increases, the musculature and soft tissues become blocked.

The case indicates that systemic sclerosis is already a very early stage. In the effort to combat such “impressive and ugly phenomenon,” systemic drug approaches are necessary. Although and physical blockage, we must be integrated at the same time. Physical patient dialog and Matrix Rhythm Therapy being together, supplemented by music or other means to stabilize Enzymopathia, myotome. We call it "Polysomatic Rheumatology."
